The DeltaSol[®] AL solar controller – high performance at an attractive price

RESOL Germany has once again extended its successful family of DeltaSol[®] solar controllers and will present the DeltaSol[®] AL controller for the first time at the Mostra Convegno trade fair in Milan.

With a brand new design, the DeltaSol[®] AL offers all vital functions required for a standard solar thermal system and that, of course, with the usual user-friendly operation provided by the large System-Monitoring-Display in combination with the intuitive operating concept. Hence, function control is easy and effortless. This controller, too, is of course equipped with the RESOL VBus[®]. To this data interface, additional modules such as remote displays and dataloggers can be connected. Additional highlights are the heat quantity measurement and the solar operating hours counter. Of course, important for the American market, the device can be switched between °C and °F and has been successfully CTUVus certified. The DeltaSol[®] AL not only manages the efficient system operation, but also is highly frugal itself – its standby power consumption adds up to only 0.7 W. For further information see www.resol.com.
