

## RESOL press release

Hattingen, 06 July 2015

### New for many mobile devices – the VBus®Touch FK app

Solid fuel boilers, water heating stoves and pellet stove heating systems have been gaining popularity for years now. Like in other areas of building management, visualisation and monitoring for biomass systems are increasing in importance as well. RESOL now offers a new solution:

With VBus®Touch FK, you can turn your mobile devices into a RESOL remote data display for your solid fuel or biomass boiler controller.

The system data are displayed in a clearly arranged, animated graphic:

- Boiler temperature
- Store top and base temperatures
- Loading status
- Heat quantity

Temperature layers inside the store are also visualised by means of a colour gradient. The app also helps to keep an eye on the sensors and will alert the user to possible technical malfunctions.

VBus®Touch FK is suitable for all RESOL controllers with a solid fuel boiler function that are connected to the Internet.

Further information and a video on VBus®Touch FK can be found at [www.resol.com](http://www.resol.com).
