Thank you for buying this product.  
Please read this document carefully, to get the best performance from this unit.

## Overview of systems

The controller is pre-programmed for 36 basic systems. For these systems and hydraulic variants, the relay and sensor

allocation has to be carried out as followed. For information on the use of a calorimeter, see page 116.

system 1 (p. 4)

system 2 (p. 6)

system 3 (p. 9)

system 4 (p. 12)

system 5 (p. 15)

system 6 (p. 18)

system 7 (p. 21)

system 8 (p. 24)

system 9 (p. 27)

system 10 (p. 30)

system 11 (p. 32)

system 12 (p. 35)

system 13 (p. 38)

system 14 (p. 41)

system 15 (p. 44)

system 16 (p. 47)

system 17 (p. 50)

system 18 (p. 53)

system 19 (p. 56)

system 20 (p. 59)

system 21 (p. 62)

system 22 (p. 65)

system 23 (p. 68)

system 24 (p. 71)

system 25 (p. 75)

system 26 (p. 78)

system 27 (p. 82)

system 28 (p. 85)

system 29 (p. 89)

system 30 (p. 92)

system 31 (p. 96)

system 32 (p. 99)

system 33 (p. 102)

system 34 (p. 106)

system 35 (p. 109)

system 36 (p. 113)

system WMZ (p. 116)

(heat quantity measurement is possible in all systems)

Information on priority logic can be found on page 115.

### Important notice:

The texts and drawings in this manual are correct to the best of our knowledge. As faults can never be excluded, please note: Your own calculations and plans, under consideration of the current standards and directions should only be basis for your projects. We do not offer a guarantee for the completeness of the drawings and texts of this manual - they only represent some examples. They can only be used at your own risk. No liability is assumed for incorrect, incomplete or false information and / or the resulting damages.

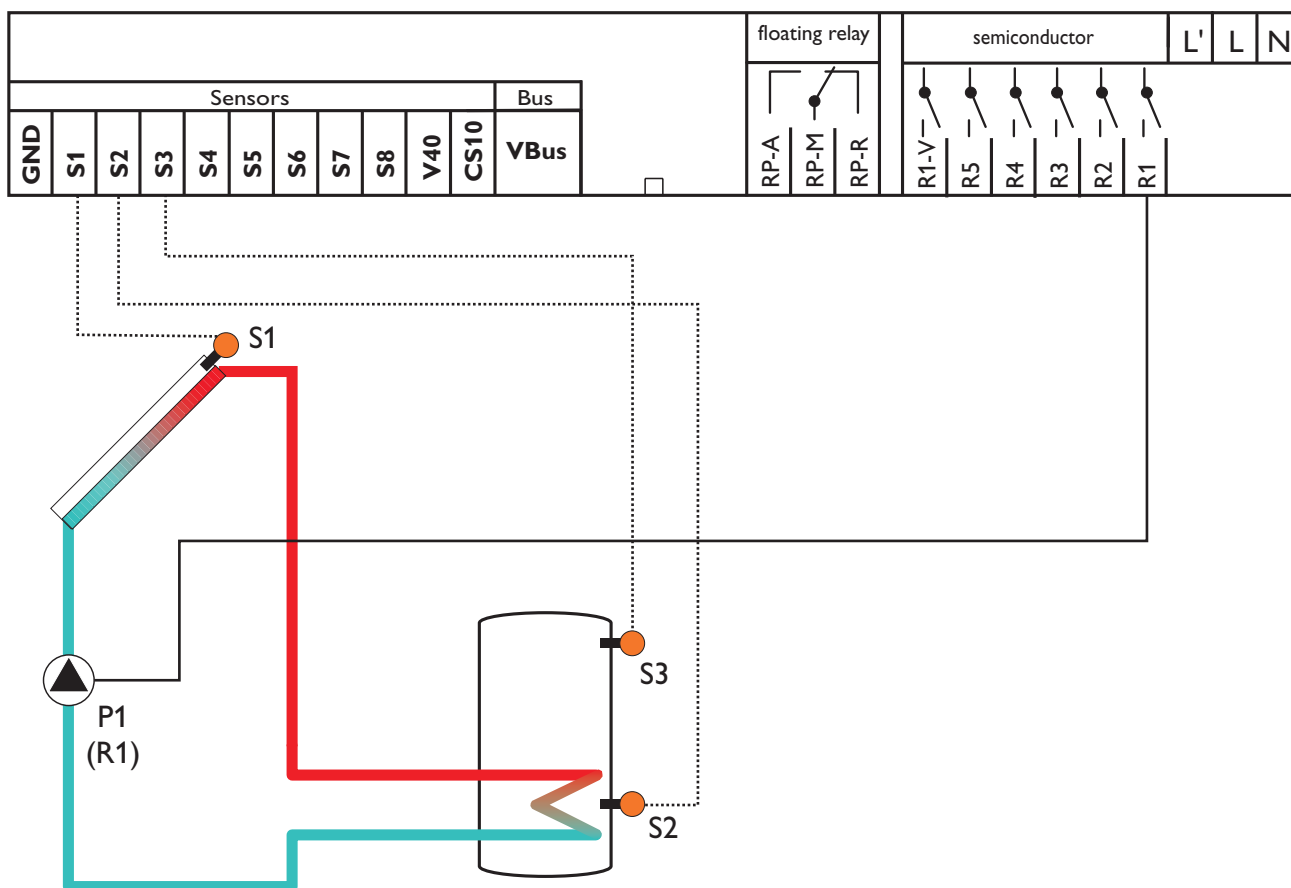

Subject to technical changes. Errors excepted.

## System Arrangement 1

### System description:

The controller calculates the temperature difference between collector sensor S1 and store sensor S2. If the difference is larger than or identical to the adjusted switch-on temperature difference, pump P1 will be switched on and

the store will be loaded until the switch-off temperature difference or the maximum store temperature is reached. Sensor S3 can optionally be connected for measurement purposes.

## System Arrangement 11

### System description:

The controller compares the temperature at sensor S1 to the temperatures at sensors S2 and S3. If the measured temperature differences are higher than the adjusted switch-on temperature differences, the pump (P1) will be activated and the corresponding store zone will be loaded up to the adjusted maximum temperature at most via the valve (V1).

The priority logic causes priority loading of the upper zone of the store.

Heat transfer control to an existant store (P2) can be carried out via another temperature differential function (S3 heat source/S4 heat sink).

Note: 3-port valve V1 normally open - boiler

## System Arrangement 15

### System description:

The controller compares the temperature at sensor S1 to the temperatures at sensors S2 and S3. If the measured temperature differences are higher than the adjusted switch-on temperature differences, the pump (P1) will be activated and the corresponding store zone will be loaded up to the adjusted maximum temperature at most via the valve (V1).

The priority logic causes priority loading of the upper zone of the store.

Via another temperature differential function (S3 heat source / S5 heat sink) heating circuit return preheating is possible via V2. Domestic hot water afterheating (P2) can be carried out via a thermostat function (S3).

Note: 3-port valve V1 normally open - store base  
3-port valve V2 normally open - boiler

## System Arrangement 20

### System description:

The controller compares the temperatures at the collector sensors S1 and S6 to the store temperature at store sensor S2. If one of the measured temperature differences is higher than the adjusted switch-on temperature differences, the corresponding pump (P1, P2) will be activated and the store

will be loaded. Via another temperature differential function (S3/S4), after-heating of the store can be carried out with a solid fuel boiler (P3).

## System Arrangement 26

### System description:

The controller compares the temperatures at the collector sensors S1 and S6 to the store temperatures at the store sensors S2 and S3. If one of the measured temperature differences is higher than the adjusted switch-on differences, the corresponding pump (P1, P2) is switched on and the corresponding store zone is loaded up to the maximum temperature at most via the valve (V1). The priority logic

causes priority loading of the upper zone of the store. With another temperature differential function (S4/S43), afterheating of the store can be carried out with a solid fuel boiler (P3).

Note: 3-port valve V1 normally open - store base

## System Arrangement 31

### System description:

The controller calculates the temperature difference between collector sensor S1 and store sensor S2. If the difference is larger than or identical to the adjusted switch-on temperature difference, pump (P1) will be switched on and the store will be loaded until the switch-off temperature difference or the maximum store temperature is reached. With another temperature differential function (S4 heat source / S5 heat sink) heating circuit return preheating

(heating circuit backup) is possible via V1. With a thermostat function (S3) domestic hot water afterheating (P2) can be carried out.

Relay output	Note

## System Arrangement 36

### System description:

The controller compares the temperatures at the collector sensors S1 and S6 to the store temperatures at the store sensors S2 and S3. If one of the measured temperature differences is higher than the adjusted switch-on differences, the corresponding pump (P1, P2) is switched on and the corresponding store zone is loaded up to the maximum

temperature at most via the valve (V1). The priority logic causes priority loading of the upper zone of the store. With another temperature differential function (S4 heat source / S5 heat sink) heating circuit return preheating is possible via V2. With a thermostat function (S3) domestic hot water afterheating (P3) can be carried out.

Relay output	Note
R1	solar pump (P1) with speed control
R2	solar pump (P2) with speed control
R3	pump - domestic hot water afterheating (P3)
R4	3-port valve (V1) store top/base
R5	3-port valve (V2) heating circuit return preheating
RP-R	
RP-M	boiler demand (potential-free), is switched on in parallel to R3
RP-A

## Corresponding adjustment values:

	factory setting	adjustment range
priority [PRIO]	1*	0-2
loading break time [tST]	2 min.	1-30 min.
oscillating loading time [tCIRC]	15 min.	1-30 min.

\* In multi-layer store systems (e.g. ARR 4) factory setting PRIO = 2 (priority store top)

## The DeltaSol ES priority logic:

The options and parameters described above are used in multi-store systems only (ARR 4-6, 11-17, 23-30, 32-33 and 35-36).

### Priority:

If priority is set to 0, the stores with a temperature difference to the collector are loaded in parallel (parallel loading, available in ARRANGEMENT 6 and 17 only).

If priority is adjusted to 1-2 the priority store will be loaded as long as its switch-on conditions are fulfilled. The subordinate store will be loaded using store sequence control. If the adjusted maximum temperature of the priority store has been reached, the subordinate store will be loaded as long as its switch-on conditions are fulfilled.

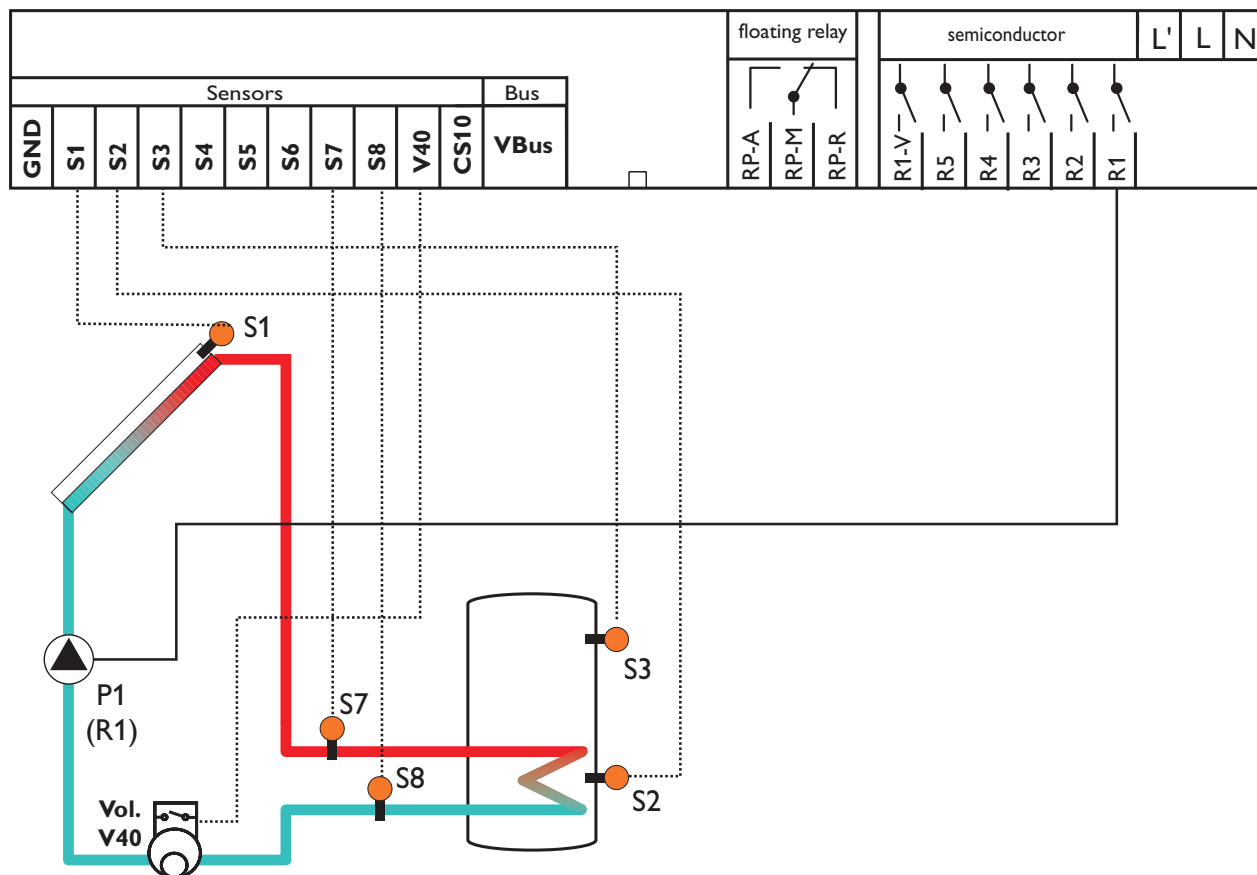

### Loading break time [tST]/ oscillating loading time [tCIRC]/ collector rise temperature

The controller checks whether the stores can be loaded (switch-on difference). When the priority store cannot be loaded, the subordinate store is checked. If the subordinate store can be loaded, it will be loaded for the oscillating loading time [t-circ.]. After this period of time, the loading process stops. The controller monitors the increase in collector temperature. If it increases by the collector rise temperature [DT-Col 2 K, fixed value in the software] within the loading break time [t-st] the elapsed break time is set to 0. The break time starts again. As soon as a switch-on condition of the priority store is fulfilled, it will be loaded. If the switch-on condition of the priority store is not fulfilled, loading of the subordinate stores will be continued. If the priority store reaches its maximum temperature, oscillating loading will not be carried out.

## System with calorimeter

### System description:

The use of the integrated calorimeter [OHQM] will be explained in the following example [Arrangement 1]: The integrated calorimeter can be activated in all pre-programmed system schematics.

Relay output	Note
R1	solar pump (P1) with speed control
