Safety advice

Please pay attention to the following safety advice in order to avoid danger and damage to people and property.

Danger of electric shock:

- When carrying out works, the device must first of all be disconnected from the mains.
- It must be possible to disconnect the device from the mains at any time.
- Do not use the device if it is visibly damaged.

Instructions

Attention must be paid to the valid local standards, regulations and directives!

Information about the product

Proper usage

The solar controller is designed for electronically controlling standard solar thermal systems and heating systems in compliance with the technical data specified in this manual.

Improper use excludes all liability claims.

EU declaration of conformity

The product complies with the relevant directives and is therefore labelled with the CE mark. The Declaration of Conformity is available upon request, please contact RESOL.

CE

Note:
Strong electromagnetic fields can impair the function of the controller.

➔ Make sure the controller as well as the system are not exposed to strong electromagnetic fields.

Target group

These instructions are exclusively addressed to authorised skilled personnel.

Only qualified electricians should carry out electrical works.

Initial installation must be effected by authorised skilled personnel.

Description of symbols

WARNING! Warnings are indicated with a warning triangle!
➔ **They contain information on how to avoid the danger described.**

Signal words describe the danger that may occur, when it is not avoided.

- **WARNING** means that injury, possibly life-threatening injury, can occur.
- **ATTENTION** means that damage to the appliance can occur.

Note:
Notes are indicated with an information symbol.

➔ Arrows indicate instruction steps that should be carried out.

Disposal

- Dispose of the packaging in an environmentally sound manner.
- At the end of its working life, the product must not be disposed of as urban waste. Old appliances must be disposed of by an authorised body in an environmentally sound manner. Upon request we will take back your old appliances bought from us and guarantee an environmentally sound disposal of the devices.

Subject to technical change. Errors excepted.

DeltaSol® BX L solar controller

The system controller DeltaSol® BX L has been especially developed as an economical solution for multi-store solar thermal systems. It features pre-programmed system layouts for a range of 2- and 3-store systems and special functions such as an extended priority and loading logic. Of course, the DeltaSol® BX L is also equipped with a thermal disinfection function, tube collector-, thermostat-, heat dump function and many more. With the integrated SD card slot, system data can easily be logged and transferred to a computer.

1   Overview

- **4 relay outputs, 5 Pt1000 temperature sensor inputs**
- **2 PWM outputs for speed control of high-efficiency pumps**
- **9 basic systems to choose from**
- **Unit °F and °C selectable**

Dimensions and minimum distances

upper fastening point

lower fastening point

Technical data

Inputs: 5 Pt1000 temperature sensors, 1 V40 impulse input
Outputs: 3 semiconductor relays, 1 electromechanical relay and 2 PWM outputs
PWM frequency: 512 Hz
PWM voltage: 10.8 V
Switching capacity:
1 (1) A 240 V~ (semiconductor relay)
4 (1) A 240 V~ (electromechanical relay)
Total switching capacity: 4 A 240 V~
Power supply: 100 – 240 V~ (50 – 60 Hz)
Supply connection: type X attachment
Standby: 0.58 W
Temperature controls class: I
Energy efficiency contribution: 1 %
Mode of operation: type 1.B.C.Y action
Rated impulse voltage: 2.5 kV
Data interface: RESOL VBus®, SD card slot
VBus® current supply: 35 mA
Functions: ΔT control, pump speed control, heat quantity measurement, operating hours counter for the solar pump, tube collector function, thermostat function, store loading in layers, priority logic, heat dump function, thermal disinfection function, function control
Housing: plastic, PC-ABS and PMMA
Mounting: wall mounting, mounting into patch panels is possible
Indication / Display: System-Monitoring-Display for system visualisation, 16-segment display, 7-segment display, 9 symbols, operating control LED (directional pad) and background illumination
Operation: 7 push buttons at the front
Ingress protection: IP 20 / EN 60529
Protection class: I
Ambient temperature: 0 … 40 °C
Pollution degree: 2
Dimensions: 198 x 170 x 43 mm

en

2   Installation

2.1   Mounting

WARNING!   **Electric shock!**
Upon opening the housing, live parts are exposed!
➔ **Always disconnect the device from power supply before opening the housing!**

Note:
Strong electromagnetic fields can impair the function of the controller.
➔ Make sure the controller as well as the system are not exposed to strong electromagnetic fields.

The unit must only be located in dry interior rooms.

If the device is not equipped with a mains connection cable and a plug, the device must additionally be supplied from a double pole switch with contact gap of at least 3 mm.

Please pay attention to separate routing of sensor cables and mains cables.

In order to mount the device to the wall, carry out the following steps:

➔ Unscrew the crosshead screw from the cover and remove it along with the cover from the housing.
➔ Mark the upper fastening point on the wall. Drill and fasten the enclosed wall plug and screw leaving the head protruding.
➔ Hang the housing from the upper fastening point and mark the lower fastening points (centres 150 mm).
➔ Insert lower wall plugs.
➔ Fasten the housing to the wall with the lower fastening screw and tighten.
➔ Carry out the electrical wiring in accordance with the terminal allocation (see chap. 2.2).
➔ Put the cover on the housing.
➔ Attach with the fastening screw.

screw

cover
2.2   Electrical connection

WARNING!   **Electric shock!**
Upon opening the housing, live parts are exposed!
➔ **Always disconnect the device from power supply before opening the housing!**

ATTENTION!   **ESD damage!**
Electrostatic discharge can lead to damage to electronic components!
➔ **Take care to discharge properly before touching the inside of the device! To do so, touch a grounded surface such as a radiator or tap!**

Note:
Connecting the device to the power supply must always be the last step of the installation!

Note:
The pump speed must be set to 100 % when auxiliary relays or valves are connected.

Note:
It must be possible to disconnect the device from the mains at any time.
➔ **Install the mains plug such that it is accessible at any time.**
➔ **If this is not possible, install a switch that can be accessed.**

If the mains cable is damaged, it must be replaced by a special connection cable which is available from the manufacturer or its customer service.

Do not use the device if it is visibly damaged!

The controller is supplied with power via a mains cable. The power supply of the device must be 100 … 240 V~ (50 … 60 Hz).

The controller is equipped with 4 relays in total to which loads such as pumps, valves, etc. can be connected:

- Relays 1 … 3 are semiconductor relays, designed for pump speed control.

  Conductor R1 … R3

  Neutral conductor N

  Protective conductor ⏚

- Relay 4 is an electromechanical relay

  Conductor R4

  Neutral conductor N

  Protective conductor ⏚

Depending on the product version, mains cables and sensor cables are already connected to the device. If that is not the case, please proceed as follows:

Connect the **temperature sensors** (S1 to S5) to the corresponding terminals with either polarity:

S1 = Sensor 1 (collector sensor)

S2 = Sensor 2 (store sensor base)

S3 = Sensor 3 (e. g. store sensor top)

S4 = Sensor 4 (e. g. store sensor store 2)

S5 = Sensor 5 (e. g. sensor collector 2)

A **V40** flowmeter can be connected to the terminals V40 and GND (either polarity).
The terminals marked **PWM** are control outputs for high-efficiency pumps.

Electrical connection of a high-efficiency pump (HE pump)

Speed control of a HE pump is possible via a PWM signal. The pump has to be connected to the relay (power supply) as well as to one of the PWM outputs A/B of the controller. In the PUMP adjustment channel, one of the PWM control types has to be selected (see page „Pump control“ on page 47).
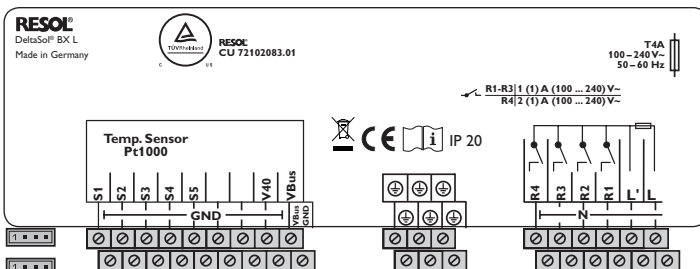

Relay allocation for PWM outputs

PWM A is allocated to R1, PWM B is allocated to R2.

Note:
For more information on pump control see page 47.

The **mains connection** is at the terminals:

Neutral conductor N

Conductor L

Protective conductor ⊜

WARNING!	Electric shock!
⚠	L' is a fused contact permanently carrying voltage.
	➔ **Always disconnect the device from power supply before opening the housing!**

Conductor L' (L' is not connected with the mains cable. L' is a fused contact per-manently carrying voltage.)

> **i** **Note:**
> The connection depends on the system layout selected (see page 8).

> **i** **Note:**
> For more details about the commissioning procedure see page 40.

2.3 Data communication / Bus

The controller is equipped with a **RESOL VBus®** for data transfer and energy supply to external modules. The connection is to be carried out at the terminals marked **VBus** (either polarity).

One or more RESOL **VBus®** modules can be connected via this data bus, such as:
- RESOL GA3 Large Display module / SD3 Smart Display
- RESOL AM1 Alarm Module
- RESOL DL2 Datalogger
- RESOL DL3 Datalogger

Furthermore, the controller can be connected to a PC or integrated into a network via the RESOL VBus®/USB or VBus®/LAN interface adapter (not included). Different solutions for visualisation and remote parameterisation are available on the RESOL website www.resol.com.
> **i** **Note:**
> More accessories on page 73.

2.4 SD memory card slot

The controller is equipped with an SD card slot.
With an SD card, the following functions can be carried out:
- Store measurement and balance values onto the SD card. After the transfer to a computer, the values can be opened and visualised, e. g. in a spreadsheet.

> **i** **Note:**
> For more information about using an SD card, see page 63.

2.5 Overview of basic system layouts
2-store system with valve logic, 1 pump, 3 sensors and 3-port valve (page 9)
2-store solar system with valve logic and heat exchange control (page 12)
2-store solar system with pump logic (page 15)
2-store solar system with pump logic and heat exchange control (page 18)
3-store solar system with valve logic and heat exchange control (page 21)
3-store solar system with pump logic and heat exchange control (page 24)
Solar system with store loading in layers and 2 stores (page 27)
Solar system with east-/west collectors and 2 stores (valve logic) (page 30)
3-store solar system with east-/west collectors (page 33)

2.6   Systems

System 1
2-store system with valve logic, 1 pump, 3 sensors and 3-port valve
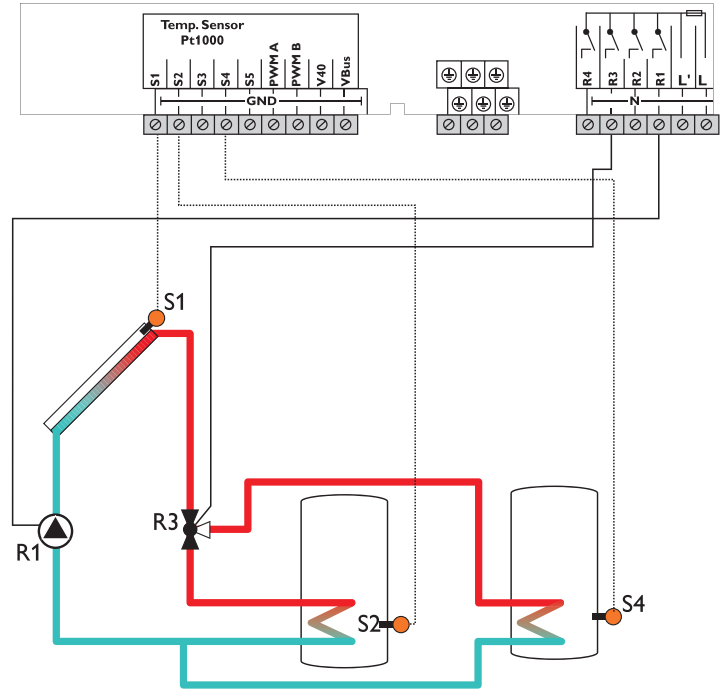

Note: 3-port valve normally open - store 1 (S2)

Sensors		
S1	Temperature collector	1 / GND
S2	Temperature store base	2 / GND
S3	Free	3 / GND
S4	Free	4 / GND
S5	Free	5 / GND

Relay		
R1	Solar pump	R1 / N / PE
R2	Free	R2 / N / PE
R3	Free	R3 / N / PE
R4	Free	R4 / R4

The controller calculates the temperature difference between collector sensor S1 and store sensor S2. If the difference is larger than or identical to the adjusted switch-on temperature difference, the pump (R1) will be switched on and the store will be loaded until the switch-off temperature difference or the maximum store temperature is reached.

System 2
2-store solar system with valve logic and heat exchange control

Temp. Sensor Pt1000

S1 S2 S3 S4 S5 PWM A PWM B V40 VBus GND

R4 R3 R2 R1 L' L
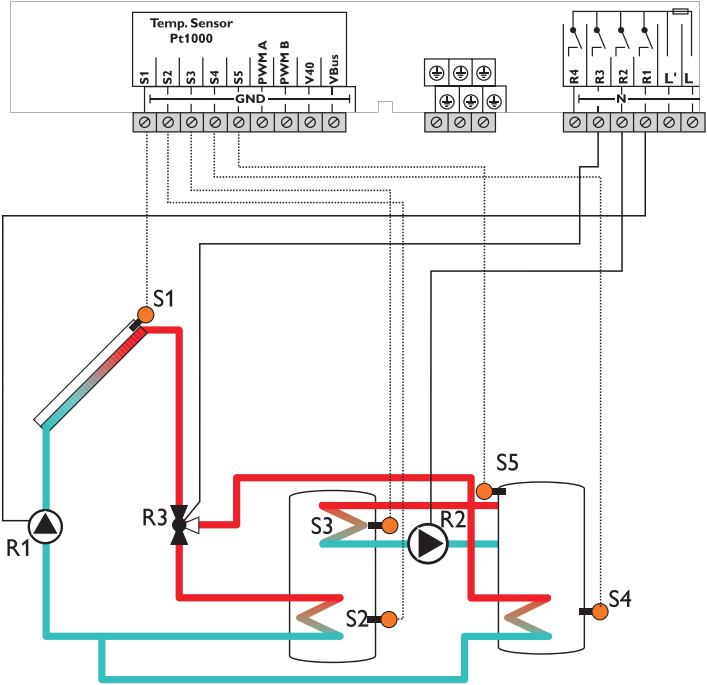

Note: 3-port valve normally open - store 1 (S2)

Sensor/terminal	Designation	Description
S1	TCOL	Temperature collector
S2	TST1B	Temperature store 1 base
S3	TST1T	Temperature store 1 top
S4	TST2B	Temperature store 2 base
S5	TST2T	Temperature store 2 top
V40		optional: flowmeter

Relay	Description
R1	Solar pump
R2	Heat exchange pump
R3	3-port valve store 1/2
R4	optional: Thermal disinfection Parallel relay Heat dump

The controller compares the temperature at sensor S1 to the temperatures at sensors S2 and S4. If the measured temperature differences are higher than the adjusted switch-on temperature differences, the pump (R1) will be activated and the corresponding store will be loaded up to the adjusted maximum temperature via the valve (R3). Store 1 is loaded with priority. Heat exchange from store 2 to store 1 (R2) is possible with another temperature differential function (S3-heat sink / S5-heat source).

System 5
3-store solar system with valve logic and priority logic

Sensor/terminal	Designation	Description
S1	TCOL	Temperature collector
S2	TST1B	Temperature store 1 base
S3		Optional sensor for measurement purposes or options
S4	TST2B	Temperature store 2 base
S5	TST3B	Temperature store 3 base
V40		Optional sensor for measurement purposes or options

Relay	Description
R1	Solar pump store 1
R2	
R3	Valve store 1/2, 3
R4	Valve store 2/3

Valve logic

Flow direction when the valve is normally open

The controller compares the temperature at sensor S1 to the temperatures at sensors S2, S4 and S5. If the measured temperature differences are higher than the adjusted switch-on temperature differences, the pump (R1) will be activated and the corresponding store will be loaded up to the adjusted maximum temperature via the valves (R3, R4). In this system, the desired store sequence can be adjusted. Depending on the valve type used, the corresponding valve logic has to be selected.

System 6
3-store solar system with pump logic and priority logic

Sensor/terminal	Designation	Description
S1	TCOL	Temperature collector
S2	TST1B	Temperature store 1 base
S3		Optional sensor for measurement purposes or options
S4	TST2B	Temperature store 2 base
S5	TST3B	Temperature store 3 base
V40		Optional sensor for measurement purposes or options

Relay	Description
R1	Solar pump store 1
R2	Solar pump store 2
R3	Solar pump store 3
R4	optional:
	Thermal disinfection
	Parallel relay
	Heat dump

The controller compares the temperature at sensor S1 to the temperatures at sensors S2, S4 and S5. If the measured temperature differences are higher than the adjusted switch-on temperature differences, the pump (R1, R2 and/or R3) will be activated and the corresponding store will be loaded up to the adjusted maximum temperature at most. Priority loading or parallel loading can be carried out in this system.

System 7
Solar system with store loading in layers and 2nd store

Valve logic

1
2
3
4
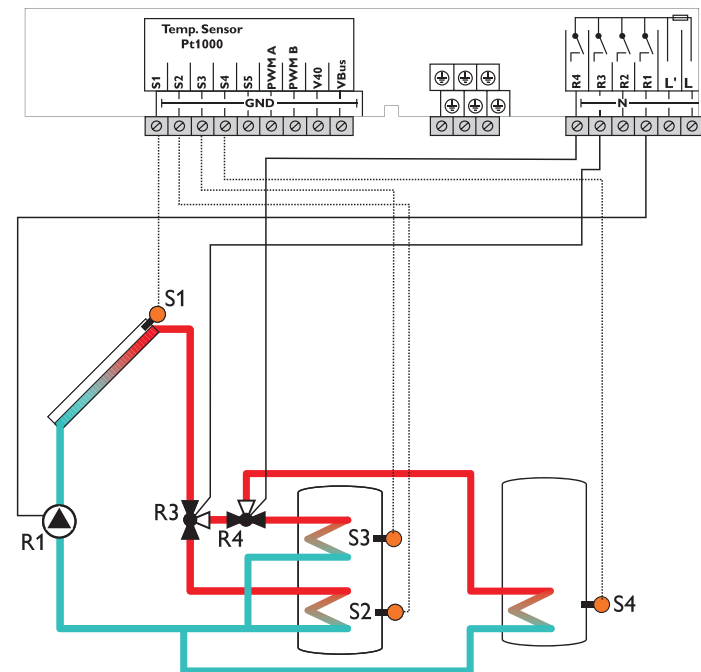

Flow direction when the valve is normally open

Note

A solar system with store loading in layers is implemented as a 2-store system. (store base = store 1; store top = store 2; additional store = store 3)

Sensor/ terminal	Designation	Description
S1	TCOL	Temperature collector
S2	TST1B	Temperature store 1 base (store 1)
S3	TST1T	Temperature store 1 top (store 2)
S4	TST3B	Temperature store 2 base (store 3)
S5		Optional sensor for measurement purposes or options
V40		

Relay	Description
R1	Solar pump store 1
R2	optional: Thermal disinfection Parallel relay Heat dump
R3	Valve store 1, 2/3
R4	Valve store 2/3

The controller compares the temperature at sensor S1 to the temperatures at sensors S2, S3 and S4. If the measured temperature differences are higher than the adjusted switch-on temperature differences, the pump (R1) will be activated (see speed control) and the corresponding store or store zone will be loaded up to the adjusted maximum temperature via the valves (R3, R4). Depending on the valve type used, the corresponding valve logic has to be selected.

System 9
3-store solar system with east-/west collectors
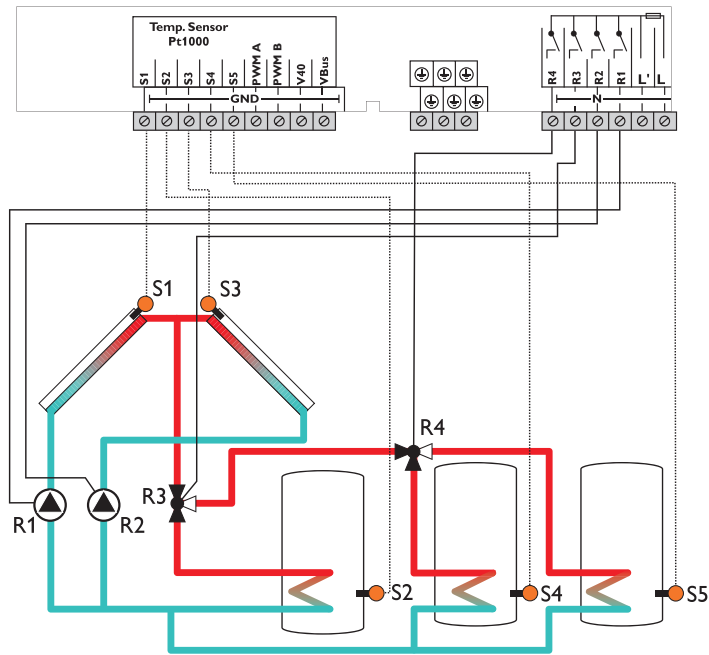

Sensor/terminal	Designation	Description
S1	TCOL	Temperature collector 1
S2	TST1B	Temperature store 1 base
S3	TCOL2	Temperature collector 2
S4	TST2B	Temperature store 2 base
S5	TST3B	Temperature store 3 base
V40		optional: flowmeter

Relay	Description
R1	Solar pump store 1
R2	Solar pump store 2
R3	Valve store 1/2, 3
R4	Valve store 2/3

The controller compares the temperatures at the collector sensors S1 and S3 to the store temperatures at the sensors S2, S4 and S5. If one of the measured temperature differences is higher than the adjusted switch-on temperature differences, the corresponding pump (R1, R2) will be activated and the corresponding store will be loaded up to the adjusted maximum temperature via the valves R3, R4. In this system, one of the stores can be loaded with priority.

3 Operation and function

3.1 Buttons
The controller is operated via the 7 buttons next to the display. They have the following functions:

Button ① - scrolling upwards

Button ③ - scrolling downwards

Button ② - increasing adjustment values

Button ④ - reducing adjustment values

Button ⑤ - confirming

Button ⑥ - menu button for changing between the status and the menu level

Button ⑦ - escape button for changing into the previous menu

3.2 Selecting menu points and adjusting values

During normal operation of the controller, the display is in the status level.

In order to leave the status level and access the menu level, press button 6.

The display indicates the level with the selectable menus. In order to change the parameters of a menu item, select the menu item and press button 5. The display changes to the adjustment level. The adjustment channels are characterised by the indication **SET**.

➜ Select the desired channel by pressing the buttons ① and ③

➜ Confirm the selection with button ⑤, **SET** starts flashing (adjustment mode)

➜ Adjust the value, the function or the option using the buttons ② and ④

➜ Confirm the selection with button ⑤, **SET** permanently appears, the adjustment has been saved.

If no button has been pressed within a couple of minutes, the adjustment is cancelled and the previous value is retained.

The menu structure of the controller consists of 3 levels: the status level, the menu level and the adjustment level.

The status level consists of different display channels which indicate display values and messages.

The menu level consists of different menu items each of which is divided into sub-menus and adjustment channels. Each of these menu items represents a function or option which can be selected. If a function or option is selected, the controller changes to the adjustment level in which the corresponding parameters of the function or option are available.

In order to activate or deactivate a function, it must be selected in the menu level. The display changes to the adjustment menu in which all adjustments required can be carried out.

During normal operation of the controller, the display is in the status level.

> **i** **Note**
> Some of the menu items depend on the selected system and the adjusted options. Therefore, they are only displayed if they are available.

> **i** **Note**
> The abstract from the menu structure shown page 36 is for information on the structure of the controller menu and is therefore not complete.

Menu level

If it is possible to jump into a sub-level, **PUSH** is indicated below the menu item. Use button ⑤ to access the menu. In order to leave the menu, press button ⑦.

If an option is deactivated, it will appear in the menu level with the addition **OFF**.

3.4 Shortcut
The controller is equipped with a shortcut that enables a quick access to the **MAN** menu (manual mode).

➔ In order to access the **MAN** menu, press buttons ⑥ and ⑦ at the same time, then press button ②.

3.5 Indications and system monitoring display

The system monitoring display consists of 3 areas:
channel display, tool bar and system screen.

Channel display

The channel display consists of 2 lines. The upper display line is an alphanumeric 16-segment display. In this line, mainly channel names and menu items are displayed. In the lower 7-segment display, channel values and the adjustment parameters are displayed.

Temperatures and temperature differences are indicated with the unit (°C/°F or K/°R respectively).

Tool bar
The additional symbols in the tool bar indicate the current system state.

Symbol	normal	flashing
ⓘ	Relay active	
☀	Maximum store limitation active / maximum store temperature exceeded	Collector cooling function active System cooling, store cooling active
❄	Antifreeze function activated	Collector minimum limitation active Antifreeze function active
⚠		Collector emergency shutdown
⚠ + 🔧		Sensor fault
⚠ + ✋		Manual mode active
⚠ + ☀		Store emergency shutdown active
SET		Adjustment channel is being changed (set mode)
COM	SD card is being used	SD card is full
✛	Indication of the buttons available in the menu item	
☺	Normal operation	

System screen in the system monitoring display

The system selected is indicated in the system monitoring display. It consists of several system component symbols which are – depending on the current status of the system – either flashing, permanently shown or "hidden".
Collectors with collector sensor
Stores 1, 2 and 3 with heat exchanger
3-port valves Only the flow direction or current switching position are indicated.

3.6   Further indications

Fault indication

If the controller detects a malfunction, the directional pad flashes red and the symbols of the warning triangle and the wrench are additionally displayed.

Smiley

If the controller operates faultlessly (normal operation), a smiley is displayed.

4   Status menu

During normal operation of the controller, the display is in the status level. This one indicates the measurement values shown in the table.

In addition to the display values, possible error messages are indicated in the status menu (see page 67).

5   Initial commissioning

When the hydraulic system is filled and ready for operation, connect the controller to the mains.

The controller runs an initialisation phase in which all symbols are indicated in the display. The directional pad flashes red.

When the controller is commissioned for the first time or when it is reset, it will run a commissioning menu after the initialisation phase. The commissioning menu leads the user through the most important adjustment channels needed for operating the system and starts with the indication of the BX L version number.

Commissioning menu

The commissioning menu consists of the channels described in the following. In order to make an adjustment, push button ⑤. The set symbol flashes and the adjustment can be made. Confirm the adjustment with button ⑤. Push button ③, the next channel will appear in the display.

button navigation

⑤   adjustment mode

④   ②   changing a value

⑤   confirming a value

③   to the next parameter

---
1. **Language:**
➔ Adjust the desired menu language.
2. **Unit:**
➔ Adjust the desired unit.

3. **Time:**
➔ Adjust the clock time. First of all adjust the hours, then the minutes.
4. **Date:**
➔ Adjust the date. First of all adjust the year, then the month and then the day.
> **i** **Note**
> If the desired system layout has been selected in the ARR channel, the ROSA channel can be skipped.

5. **System:**
➔ Adjust the desired system.

6. **ROSA:**
➔ Enter the 4-digit number given by the RESOL Online Service Assistant.
7. Valve logic:
➔ Adjust the valve variant of the 3-port valves

Note
The valve variant can only be adjusted in systems with two 3-port valves (ARR 5,7,9).

8. Maximum store temperature:
➔ Adjust the maximum store temperature
In 3-store systems, the adjustment has to be carried out for **S2MAX** and **S3MAX** as well.

SET
5 1MAX
60°C

Note
"Loading store 3" can only be adjusted if a 3-store system or store loading in layers has been selected in the sub-channel **ARR.**
9. Loading store 2 and store 3
➔ Switch on or off the "loading store 2"/"loading store 3" option.

SET
LST2
On
10. Pump control type:
➔ Adjust the type of pump control for **PUMP1**.
Carry out this adjustment for PUMP2, PUMP3 if needed.

SET
PUMP 1
PSOL

11. Minimum speed:
➔ Adjust the minimum speed of the pump PUMP1.
For systems with 3 pumps, the adjustments must also be carried out for PUMP2, PUMP3

SET
n 1LO
20

Note
The minimum speed can only be adjusted if burst control (PULS) or speed control via an adapter (ADAP) has been selected in the sub-channel **PUMP1,2,3.**
12. Maximum speed:
➔ Adjust the maximum speed of the pump PUMP1.
For systems with 2 or 3 pumps, the adjustments must also be made for PUMP2, PUMP3.

SET
n 1HI
100

Note
The maximum speed can only be adjusted if burst control (PULS) or speed control via an adapter (ADAP) has been selected in the sub-channel **PUMP1,2,3.**

➔ **Complete the commissioning menu by pressing button 5:**
The controller is then ready for operation and normally the factory settings will give close to optimum operation.

SET
OK

en

6 Functions and options

6.1 Status level

i	**Note** The values and adjustment channels shown depend on the selected system, the functions and options and will only be displayed in the installer level.

Display of collector temperatures

```
              SET
       TCOL
      85.0°C
```
TCOL(1, 2)
Collector temperature
Display range: -40 … +260 °C

Displays the current collector temperature.
- TCOL   : Collector temperature (1-collector system)
- TCOL1 : Collector temperature 1 (2-collector system)
- TCOL2 : Collector temperature 2 (2-collector system)

Display of store temperatures

```
              SET
      TST 1B
      85.0°C
```

TST1 (2, 3)B, TST1 (2)T
Store temperatures
Display range: -40 … +260 °C

Displays the current store temperature.
- TST1T : Temperature store 1 top
- TST1B : Temperature store 1 base
- TST2T : Temperature store 2 top
- TST2B : Temperature store 2 base

  in 3-store systems only:
- TST3B : Temperature store 3 base

Display of temperatures at S3, S4 and S5

```
       S3
      30.4°C
```
S3, S4, S5
Sensor temperatures
Display range: -40 … +260 °C
Indicates the current temperature at the corresponding additional sensor (without control function).
- S3 : Temperature sensor 3
- S4 : Temperature sensor 4
- S5 : Temperature sensor 5

i	**Note** Only if temperature sensors are connected, will S3, S4 and S5 be displayed.

i	**Note** For heat exchange etc., S3/S5 are used as heat source / heat sink sensor respectively.

Display of further temperatures

```
              SET
      TFHQM
      85.0°C
```

DTS1, DTS2, SENTH, TFHQM, TRHQM
Further measured temperatures
Display range: -40 … +260 °C

Indicates the current temperature at the corresponding sensor. The display of these temperatures depends on the system selected.
- DTS1   : Temperature heat source ΔT function
- DTS2   : Temperature heat sink ΔT function
- SENTH : Temperature thermostat function
- TFHQM : Temperature flow (HQM)
- TRHQM : Temperature return (HQM)

en

Display of flow rate

```
               SET
         L/h
         32
```
L/H
Flow rate
Display range: 0 … 9999 l/h

Indicates the flow rate in the solar system during heat quantity measurement. During heat quantity balancing, the fixed flow rate value adjusted is indicated.

Display of speed

```
               SET
         n 1%
         100
```
N1% , N2% , N3%
Current pump speed
Display range: 30 … 100 %
20 … 100 % if ADAP is adjusted

Indicates the current speed of the corresponding pump.

Operating hours counter

```
               SET
         h R1
         305
```
H R (1, 2, 3, 4)
Operating hours counter

The operating hours counter accumulates the solar operating hours of the relay (h R1 / h R2 / h R3 / h R4). Full hours are displayed.

The accumulated operating hours value can be set back to 0. As soon as one operating hours channel is selected, the symbol **SET** is displayed.

➔ In order to access the RESET mode of the counter, press the set button ⑤.

The **SET** symbol flashes and the security enquiry appears.

➔ Confirm the security enquiry by selecting "Yes"

➔ Confirm the reset with the set button ⑤ in order to finish the reset.

In order to interrupt the RESET process, do not press any button for about 5 s. The display returns to the display mode.

Display of heat quantity

```
               SET
        KWh
          51
```

KWH/MWH:
Heat quantity in kWh / MWh

Indicates the heat quantity produced in the system. For this purpose, the heat quantity measurement option has to be activated.

The flow rate as well as the values of the reference sensors S1 (flow) and S4 (return) are used for calculating the heat quantity supplied. It is shown in kWh in the channel **kWh** and in MWh in the channel **MWh**. The overall heat quantity results from the sum of both values.

The accumulated heat quantity value can be set back to 0. As soon as one of the display channels of the heat quantity is selected, the **SET** symbol is displayed.

➔ In order to access the RESET mode of the counter, press the set button ⑤.

The **SET** symbol flashes and the security enquiry appears.

en

➔ Confirm the security enquiry by selecting "Yes"

➔ Confirm the reset with the set button in order to finish the reset.

In order to interrupt the RESET process, no button should be pressed for about 5 s. The display returns to the display mode.

Display of monitoring period

SET

CDIS

01:00

CDIS
Countdown of the monitoring period
Display range: 0 … 30:0 … 24 (dd:hh)

If the thermal disinfection option (**OTDIS**) is activated and the monitoring period is in progress, the remaining time of the monitoring period is displayed as **CDIS** (in hours and minutes), counting backwards.

Display of starting time

SET

SDIS

18:00
SDIS
Starting time
Display range: 0:00 … 24:00 (o'clock)

If the thermal disinfection option (**OTDIS**) is activated and starting delay time has been adjusted, the adjusted delay time is displayed (flashing) in this channel.

Display of heating period

SET

TDIS

00:59
TDIS
Heating period
Display range: 0:00 … 23:59 (hh:mm)

If the thermal disinfection option (**OTDIS**) is activated and the heating period is in progress, the remaining time of the heating period is displayed (in hours and minutes) in this channel, counting backwards.

Display of time

SET

TIME

15:30
TIME
Time
Adjust the current clock time.

The following display channels are only indicated when the corresponding function is active.

Display ΔT function active

SET

DTFCT

On

DTFCT
ΔT function active

Display thermostat function active

```
THERM
On
```

THERM
Thermostat function active

Display of blocking protection time

```
SET
BLPR 1
```
BLPR1(2, 3, 4)
Blocking protection active

In order to protect the pumps against blocking after standstill, the controller is equipped with a blocking protection function. When the blocking protection is activated, this function switches on the relays one after another every day at 12:00 a.m. for 10 s at 100 %.

6.2   Adjustment channels

Selecting the system

```
SET
ARR
1
```

ARR
System
Adjustment range: 1 … 9
Factory setting: 1

Selection of the appropriate system. Each system has pre-programmed options and adjustments which can be activated or changed respectively if necessary. Select the system first (see chap. 3).

∆T control

```
SET
DT O
6.0 K
```
LOAD(1, 2, 3) / DT1(2, 3) O
Switch-on temperature diff.
Adjustment range: 1.0 … 50.0 K
in steps of 0.5 K
Factory setting: 6.0 K

The controller works as a standard differential controller. If the switch-on difference is reached, the pump is activated. When the temperature difference reaches or falls below the adjusted switch-off temperature difference, the respective relay switches off.

en

SET

_DT F_
_4.0_ K

LOAD(1, 2, 3) / DT1(2, 3) F
Switch-off temperature diff.
Adjustment range: 0.5 … 49.5 K
in steps of 0.5 K
Factory setting: 4,0 K

> **i** **Note**
> The switch-on temperature difference must be at least 0.5 K higher than the switch-off temperature difference. The set temperature difference must be at least 0.5 K higher than the switch-on temperature difference.

Speed control

SET

_DT S_
_10.0_ K
LOAD(1, 2, 3) / DT1(2, 3) S
Set temperature difference
Adjustment range: 1.5 … 50.0 K
in steps of 0.5 K
Factory setting: 10.0 K

> **i** **Note**
> To enable speed control, the corresponding relay has to be set to "Auto" (adjustment channel **MAN**) and the pump control type has to be set to Puls, or ADAP (adjustment channel **PUMP**).

SET

RIS
_2_ K

LOAD(1, 2, 3) / RIS(1, 2, 3)
Rise
Adjustment range: 1 … 20 K
in steps of 1 K
Factory setting: 2 K

When the switch-on temperature difference is reached, the pump is activated at 100% speed for 10 s. Then, the speed is reduced to the minimum pump speed value.

If the temperature difference reaches the adjusted nominal value (**DT S**), the pump speed increases by one step (10 %). The response of the controller can be adapted via the parameter "Rise". If the difference increases by the adjustable rise value RIS, the pump speed increases by 10 % until the maximum pump speed of 100 % is reached. If, at decreasing temperatures, the temperature difference decreases by the adjustable rise value **RIS**, the pump speed decreases by 10 %.

Maximum store temperature

SET

SMAX
_60_ °C

LOAD(1, 2, 3) / S1(2, 3) MAX
Maximum store temperature
Adjustment range: 4 … 95 °
in steps of 1 °C
Factory setting: 60 °C

If the store temperature reaches the adjusted maximum temperature, the store will no longer be loaded in order to avoid damage caused by overheating. The ☀ symbol is shown on the display if the store temperature exceeds the maximum value.

The corresponding reference sensor can be chosen, see "Sensor maximum store temperature".

Switch-on hysteresis -2 K

Sensor maximum store temperature

```
          SET
SMXS 1
    2
```

LOAD(1, 2) / SMXS1 (2)

Sensor store maximum temp.
Adjustment range: 1st store: S2, S3; 2nd store: S4, S5
Store being loaded in layers: S2, S3
Factory setting: 1st store: S2; 2nd store: S4

Sensor allocation for the store maximum limitation. The maximum limitation always refers to the sensor selected.

If e. g. S3 is selected, the differential control will still be carried out using S1 and S2. The temperature at S2 can exceed the adjusted limit temperature, the system will not switch off. If the value at S3 reaches the limit temperature, the system will be switched off.

Loading store 2 and store 3

> **i** **Note**
> In 3-store systems, the reference sensor can only be selected for the numerically 1st store.

```
          SET
LST2
  On
```
LOAD2 (3)/ LST2 (3)

Loading store 2, 3
Selection: ON / OFF
Factory setting: ON

In a multi-store system, the second store or the third store can be switched off for loading by means of the parameter LST2 or LST3 respectively.

If the parameter is set to OFF, the system runs like a 2-store, or a 1-store system respectively. The representation in the display remains the same.

Pump control

```
          SET
PUMP
 OnOF
```

PUMP / PUMP1 (2, 3,)

Pump control
Selection: OnOF, Puls, ADAP, PSOL
Factory setting: system-dependent (PUMP3: OnOF)

With this parameter, the pump control type can be adjusted. The following types can be selected:

Adjustment for standard pump without speed control:
• OnOF : Pump on / pump off

Adjustment for a standard pump with speed control:
• PULS : Burst control via semiconductor relay

Adjustment for a high-efficiency pump (HE pump):
• PSOL : Speed control via a PWM signal
        Relay allocation for PWM outputs:
        PWM signal PWM A for R1, PWM B for R2.

Adjustment for a high-efficiency pump (HE pump) with speed control via adapter:
• ADAP : Pump on / pump off; the corresponding relay (R1 … 3) remains
        switched on for one hour after the switch-off condition has been
        fulfilled.
        Speed control can be carried out via an adapter, e. g. the VBus® / PWM
        interface adapter.

> **i** **Note**
> With the factory setting, speed control at R3 is not possible.

> **i** **Note**
> For more information about connecting HE pumps, see page 6.

Minimum speed
PUMP1 (2, 3) / N1 (2, 3) LO
Speed control
Adjustment range: 30 … 100 %;
20 … 100 % if ADAP and PSOL are adjusted
in steps of 5%
Factory setting: 20 % (PUMP3: 30%)

In the adjustment channel **n1(2, 3)LO**, a relative minimum speed for connected pumps can be allocated to the outputs R1, R2 and R3.

> **i** **Note**
> When loads which are not speed-controlled (e. g. valves) are used, the value of the corresponding relay (n1, n2, n3) must be set to 100% or the pump control type must be set to OnOF in order to deactivate pump speed control.

Maximum speed
PUMP1 (2, 3) / N1 (2, 3) HI
Speed control
Adjustment range: 30 … 100 %;
20 … 100 % if ADAP and PSOL are adjusted
in steps of 5%
Factory setting: 100 %

In the adjustment channel **n1(2, 3)HI**, a relative maximum speed for connected pumps can be allocated to the outputs R1, R2 and R3.

> **i** **Note**
> When loads which are not speed-controlled (e. g. valves) are used, the value of the corresponding relay (n1, n2, n3) must be set to 100% or the pump control type must be set to OnOF in order to deactivate pump speed control.

Collector emergency shutdown

COL(1,2) / CEM(1,2)
Collector temperature limitation
Adjustment range: 80 … 200 °C
in steps of 1 °C
Factory setting: 130 °C
Switch-on hysteresis: -10 K

When the collector temperature exceeds the adjusted collector emergency temperature (**CEM / CEM1 / CEM2**), the solar pump (R1/R2) is switched off in order to protect the system components against overheating (collector emergency shutdown). If the maximum collector temperature is exceeded, ⚠ is displayed (flashing).

Collector cooling

COL(1,2) / OCCO(1,2)
Selection: OFF / ON
Factory setting: OFF

This function is used for keeping the system temperatures and consequently the thermal load as low as possible.

When the store temperature exceeds the adjusted maximum store temperature, the solar system is switched off. If the collector temperature increases to the adjusted maximum collector temperature, the solar pump is activated until the collector temperature falls below the maximum collector temperature. The store temperature may then exceed the maximum temperature, but only up to 95°C (emergency shutdown of the store).

If the collector cooling is active, ☀ is displayed (flashing).

SET
CMAX
110°C

COL (1,2) / OCCO(1,2) / CMAX(1,2)
Collector maximum temp.
Adjustment range: 70 … 160 °C
in steps of 1 °C
Factory setting: 110 °C
Switch-on hysteresis: -5K

i **Note**
This function is only available, if the system cooling function and the heat dump function are deactivated.

Minimum collector limitation

SET
OCMI
OFF
COL(1,2) / OCMI(1,2)
Collector minimum temp.
Selection: ON / OFF
Factory setting: OFF

SET
CMIN
10.0°C

COL (1,2) / OCMI(1,2) / CMIN(1,2)
Collector minimum temp.
Adjustment range: 10 … 90 °C
Factory setting: 10 °C

The minimum collector temperature is the minimum switch-on temperature which must be exceeded for the solar pump (R1/R2/R3) to switch on. The minimum temperature prevents the pump from being switched on too often at low collector temperatures. If the collector temperature falls below the adjusted minimum temperature, ❄ is displayed (flashing).

Tube collector function

SET
OTCO
OFF
COL / OTCO (1, 2)
Tube collector function
Selection: ON / OFF
Factory setting: OFF

SET
TCST
07:00

COL / OTCO (1, 2) / TCST (1, 2)

Standstill interval
Adjustment range: 5 … 60 min
Factory setting: 30 min

This function helps overcome the non-ideal sensor position with some tube collectors.

This function operates within an adjusted time frame, beginning at **TCST** and ending at **TCEN**. It activates the collector circuit pump for an adjustable runtime (**TCRU**) between adjustable standstill intervals (**TCIN**) in order to compensate for the delayed temperature measurement.

If the runtime **TCRU** is set to more than 10 s, the pump will be run at 100 % for the first 10 s of the runtime. For the remaining runtime, the pump will be run at the adjusted minimum speed **nLO**.

If the collector sensor is defective or the collector is blocked, this function is suppressed or switched off.

2-collector systems

In 2-collector systems, the tube collector function is available for each collector field (**OTCO2**).

If one of the collector fields is being loaded, the heat transfer fluid flows through the inactive field and only the corresponding relay is energised.

Multi-store systems

If the tube collector function is activated, the speed of the solar pump will decrease to the minimum speed nLO during the loading break time. The solar loading of the subordinate store will continue.

In 2-collector systems, the collector field which has been active before the loading break time remains active during the loading break time, unless the tube collector function of the inactive field becomes active.

Antifreeze function

The antifreeze function activates the loading circuit between the collector and the store when the collector temperature falls below the adjusted temperature **CFR O**. This will protect the fluid against freezing or coagulating. If **CFR F** is exceeded, the solar pump will be switched off again. The antifreeze function will be suppressed if the store temperature of the selected store falls below 5 °C. In 2-store systems, the function will in this case be switched to the 2nd store. In a system with store loading in layers it will be switched to the upper store zone. If the temperature of the 2nd or 3rd store (or of the upper store zone respectively) also falls below 5 °C, the system will be switched off.

> **i** **Note**
> This function can only become active if the store temperature is higher than the collector temperature.

> **i** **Note**
> Since this function uses the limited heat quantity of the store, the antifreeze function should be used in regions with few days of temperatures around the freezing point.

Priority logic

SET OCFR OFF	**SET** CFR O 4.0 °C

COL (1) / OCFR
Antifreeze function
Selection: ON / OFF
Factory setting: OFF

COL (1) / OCFR / CFR O
Antifreeze temperature on
Adjustment range: -40.0 … +9.0 °C
Factory setting: 4.0 °C

SET CFR F 5.0 °C	**SET** FRPST 1

COL (1) / OCFR / CFR F
Antifreeze temperature off
Adjustment range: -39.0 … +8.0 °C
Factory setting: 5.0 °C

COL (1) / OCFR / FRPST
Store sensor selection
(in 2- and 3-store systems only)
Selection: 1, 2, 3
Factory setting: 1

SET PRIO 1	**SET** PRIO1 1

LLOGI / LOGIC
Priority logic
Selection: Prio, SuLA, StUF, PAr, bLO
Factory setting: PRIO

LLOGI / PRIO1 (2, 3)
Priority
Adjustment range: 1, 2, 3
Factory setting: 1

SET tLB 2	**SET** tRUN 15
LLOGI / TLB
Loading break time
Adjustment range: 1 … 30 min
Factory setting: 2 min

LLOGI / TRUN
Oscillating loading runtime
Adjustment range: 1 … 30 min
Factory setting: 15 min

Priority logic can be used in 2-store systems, 3-store systems or systems with store loading in layers and determines how the heat is divided between the stores. Different types of priority logic are adjustable:
1. Store sequence control (PRIO)
2. Successive loading (SuLA)
3. Progressive loading (StUF)
4. Parallel loading (PAr)
5. Loading in blocks (bLO)

1. In store sequence control (PRIO), a priority (1 = highest priority) is assigned to the store (PRIO1 = store 1, PRIO2 = store 2; the priority of the 3rd store is determined by the priority of the first 2 stores).

The priority store will be loaded if its switch-on conditions are fulfilled and if it is not blocked. If the priority store is not blocked but its switch-on conditions are not fulfilled, the store sequence control starts provided that the switch-on conditions of the subordinate store are fulfilled. If a subordinate store can be loaded, it will be loaded for the oscillating loading time tRUN. After the loading time has ended, the pump is switched off for the adjustable loading break tLB. If during this time the priority store can be loaded, it will be loaded. If the priority store has reached its maximum temperature, the subordinate store next in priority will be loaded. If the switch-on conditions for the first subordinate store are not fulfilled, but the switch-on conditions for the last subordinate store are fulfilled, the store sequence control will start working on both subordinate stores. If the first subordinate store has also reached its maximum temperature, the last subordinate store will be loaded up to its maximum temperature, if possible, without store sequence control.

2. In successive loading (SuLA), the priority store will be loaded up to its maximum temperature first. Only when the priority store is fully loaded, will the subordinate store(s) next in priority be loaded.

3. In progressive loading (StUF), the store with the lowest temperature is loaded first. As soon as the temperature of the store being loaded exceeds the temperature of the next store by 5 K, loading switches to the cooler store. If the temperature of that store is by 5 K higher than the temperature of the third store, loading switches to the third store. From then on, progressive loading will continue in a loop, as long as there is a sufficient temperature difference between the store being loaded and the collector.

4. In parallel loading (PAr), all stores with a sufficient temperature difference to the collector are loaded in parallel up to their maximum temperatures.

This option is only available if each store has its own pump (ARR = 3, 4, 6).

LLOGI/LOGIC/BLO1 (2)
Loading in blocks
Selection:
PRIO, SuLA, StUF
Factory setting: PRIO

5. In systems with 3 stores or 2 stores and store loading in layers, **bLO** loading is possible. This means that 2 stores are combined to one. The **PRIO1...3** adjustment determines the loading priority and which stores are being combined. Stores with the same PRIO adjustment are combined. This common value is used as the loading priority of the combined store.

In the channel **BLO1**, the loading type of the combined store, in relation to the single remaining store, can be adjusted.

In the channel **BLO2**, the loading type of the two individual stores of the combined store can be adjusted.
Store set option

```
                    SET
        OSTS
        OFF
```
LLOGI / OSTS
Store set option
Selection: ON / OFF
Factory setting: OFF

```
                    SET
        TST1
        45℃
```
LLOGI / TST1
Set temperature store 1
Adjustment range: 4 … 85 °C
in steps of 1 °C
Factory setting: 45 °C

```
                    SET
        TST2
        45℃
```

LLOGI / TST2
Set temperature store 2
Adjustment range: 4 … 85 °C
in steps of 1 °C
Factory setting: 45 °C

```
                    SET
        TST3
        45℃
```

LLOGI / TST3
Set temperature store 3
Adjustment range: 4 … 85 °C
in steps of 1 °C
Factory setting: 45 °C

Additionally, the following options can be activated:

Store set option OSTS: With this function, a set temperature can be adjusted for each store.

If the selected priority store reaches its set temperature, the subordinate stores will be loaded successively up to their set temperatures. After that, the priority store is loaded up to its maximum temperature, then store 2 and then store 3.

Spreaded loading option
(only in ARR 3, 4, 6 with differing priority)

```
                    SET
        OSE
        OFF
```

LLOGI / PRIO / OSE
Spreaded loading option
Selection: ON / OFF
Factory setting: OFF

Spreaded loading option OSE: In 2- and 3-store systems with 2 or 3 pumps, a spreaded loading option can be activated:

As soon as the adjustable spread difference **DTSE** between the collector and the reference store is reached, the absorption store will be loaded in parallel unless it is blocked. If the temperature difference falls by 2 K below **DTSE**, the absorption store will no longer be loaded.

```
                    SET
        DTSE
        40 K
```

LLOGI / PRIO / DTSE
Temperature diff. spreaded loading
Adjustment range: 20 … 90 K
Factory setting: 40 K

```
                    SET
        SLSTR
        1
```
LLOGI / PRIO / SLSTR
Reference store
Adjustment range: 1, 2, 3
Factory setting: 1

```
                    SET
        SLSTA
        2
```
LLOGI / PRIO / SLSTA
Absorption store
Adjustment range: 1, 2, 3
Factory setting: 2

en

Pause control

LLOGI / PSPEE
Pause speed
Selection: ON / OFF
Factory setting: OFF

If the pause speed is activated, the relay of the store which has been loaded last remains switched on during the loading break time. Speed is determined by the value adjusted in **nLO**.
LLOGI / PDELA
Pump delay
Selection: ON / OFF
Factory setting: OFF

This function takes into account the actuation times of valves and switches on the pump with a delay.

If the pump delay is activated, the corresponding relay for the valve will be energised first. The pump(s) will be activated with the delay time (200s).

Cooling functions

Different cooling functions can be activated: system cooling, store cooling and heat dump.
System cooling

COOL / OSYC
System cooling option
Adjustment range: OFF / ON
Factory setting: OFF
COOL / DTCO
Switch-on temperature diff.
Adjustment range: 1.0 … 30.0 K
Factory setting: 20,0 K
COOL / DTCF
Switch-off temperature diff.
Adjustment range: 0.5 … 29.5 K
Factory setting: 15.0 K

The system cooling function aims to keep the solar system operational for a longer time. The function overrides the maximum store temperature to provide thermal relief of the collector field and the heat transfer fluid on hot days.

If the store temperature is higher than the adjusted maximum store temperature and the switch-on temperature difference DTCO is reached, the solar system remains activated or is switched on. Solar loading is continued until either the temperature difference falls below the adjusted value **DTCF** or the collector emergency shutdown temperature CEM is reached.

If the system cooling function is active, ☀ is shown on the display (flashing).

Store cooling

COOL / OSTC
Store cooling option
Selection: OFF / ON
Factory setting: OFF

When the store cooling function is activated, the controller aims to cool down the store during the night in order to prepare it for solar loading on the following day.

If the adjusted maximum store temperature (**S1MAX / S2MAX / S3MAX**) is exceeded and the collector temperature falls below the store temperature, the system will be reactivated in order to cool down the store.

Reference temperature differences are **DT1 (2, 3) O** and **DT1 (2, 3) F**.

Heat dump

COOL / OHDP
Heat dump
Selection: ON / OFF
Factory setting: OFF

COOL / OTCL
Overtemperature collector
Adjustment range: 70 … 160 °C
Factory setting: 110 °C
COOL / OTPUM
Pump or valve logic
Selection: ON / OFF
Factory setting: OFF

COOL / HDREL
Heat dump relay
Selection: system dependent
Factory setting: 3/4

If the heat dump function **OHDP** is activated, the selected relay is energised with 100%, if the collector temperature reaches the adjusted collector overtemperature **OTCL**. If the collector temperature falls by 5 K below the adjusted collector overtemperature **OTCL**, the relay will be switched off.

A selection can be made between pump logic and valve logic (**OTPUM ON** = pump logic, **OTPUM OFF** = valve logic). If pump logic is selected, the relay for solar loading switches off and the relay for heat dump remains switched on.

The relay for the heat dump function can be selected in the **HDREL** channel.

> **Note**
> The adjustable value **OTCL** is locked against the collector emergency temperature **CEM** by 10 K. The heat dump function will only be available if the collector cooling function and the system cooling function are deactivated.
Heat exchange function
SET

DT4O

6.0 K

DT4 / DT4O
Switch-on temperature diff.
Adjustment range: 1.0 … 30.0 K
Factory setting: 6.0 K
SET

DT4F

4.0 K

DT4 / DT4F
Switch-off temperature diff.
Adjustment range: 0.5 … 29.5 K
Factory setting: 4.0 K

SET
DT4S

10.0 K

DT4 / DT4S
Set temperature difference
Adjustment range: 1.5 … 50.0 K
Factory setting: 10.0 K

SET

RIS4

2 K

DT4 / RIS4
Rise
Adjustment range: 1 … 20 K
Factory setting: 2 K

The heat exchange function is used for transporting heat from store 2 to store 1.

The reference sensor (heat source) for the heat exchange function for store 2 is sensor S5 (TST2T). The reference sensor (heat sink) for store 1 (TST1T) is S3. It is used as a reference sensor for the differential function and for the maximum limitation.

Additionally, minimum and maximum temperature limitations and the corresponding switch-on and switch-off differences can be set for the independent temperature differential control. Both switch-on and switch-off temperature differences **DT4O** and **DT4F** as well as the set temperature difference **DT4S** and rise **RIS4** are valid.

i	**Note**
	The heat exchange function is available in system 2 and 4 only.

Maximum temperature limitation for the heat exchange

SET

MAX4O

60.0 ℃

DT4 / MAX4O
Switch-on temperature
Adjustment range: 0.5 … 95.0 °C
Factory setting: 60.0 °C

SET

MAX4F

58.0 ℃
DT4 / MAX4F
Switch-off temperature
Adjustment range: 0.0 … 94.5 °C
Factory setting: 58.0 °C

If the adjusted value **MAX4O** is exceeded, the relay will be switched off. If the temperature falls below the adjusted value **MAX4F**, the relay will be energised.
Minimum temperature limitation for the heat exchange

SET

MIN4O

5.0 ℃

DT4 / MIN4O
Switch-on temperature
Adjustment range: 0.0 … 94.5 °C
Factory setting: 5.0 °C

SET

MIN4F

10.0 ℃

DT4 / MIN4F
Switch-off temperature
Adjustment range: 0.5 … 95.0 °C
Factory setting: 10.0 °C

If the temperature falls below the adjusted value **MIN4O**, the relay will be switched off. If the adjusted value **MIN4F** is exceeded, the relay will be energised.

The relay for the ΔT function can be selected.

en

Freely adjustable thermostat function

Backup heating

Use of surplus energy

The thermostat function works independently from the solar operation and can be used for using surplus energy or for backup heating.

• **AH O** < **AH F**

thermostat function for backup heating
• **AH O** > **AH F**

 thermostat function for using surplus energy

OTH
Thermostat function
Adjustment range: ON / OFF
Factory setting: OFF

OTH / TH O
Thermostat switch-on temp.
Adjustment range: 0.0 … 250.0 °C
Factory setting: 40.0 °C

OTH / TH F
Thermostat switch-off temp.
Adjustment range: 0.0 … 250.0 °C
Factory setting: 45.0 °C

OTH / T1O
Switch-on time 1
Adjustment range: 00:00 … 23:45
Factory setting: 06:00

**OTH / T1F**
Switch-off time 1
Adjustment range: 00:00 … 23:45
Factory setting: 22:00

In order to block the thermostat function for a certain period, there are three time frames t1 … t3. The switch-on and switch-off times can be adjusted in steps of 15 minutes. If the switch-on and the switch-off times are identical, the time frame is inactive.

If the thermostat function should run from 06:00 a.m. and 09:00 a.m. only, adjust t1O to 06:00 a.m. and t1F to 09:00 a.m.

The first time frame is factory set from 06:00 to 22:00.

If the switch-on and switch of times of a frame are set to an identical value, the time frame is inactive. If all time frames are set to 00:00, the thermostat function is solely temperature dependent.

OTH / T2 (3) O
Switch-on time 2 (3)
Adjustment range: 00:00 … 23:45
Factory setting: 00:00

OTH / T2 (3) F
Switch-off time 2 (3)
Adjustment range: 00:00 … 23:45
Factory setting: 00:00

```
                    SET
              STH
                S3
```

OTH / STH
Thermostatic backup heating sensor
Selection: S3, S5
Factory setting: S3 / S5
Depending on the system selected, the sensor for the thermostatic backup heating can either be selected or is pre-set.

```
                    SET
              RTH
                3
```

OTH / RTH
Thermostatic backup heating relay
Selection:
Factory setting: R3
Depending on the system selected, the relay for the thermostatic backup heating can either be selected or is pre-set.

Manual mode

```
                    SET                              SET
              MAN 1                            MAN4
              Auto                             Auto
```

MAN / MAN1 (2, 3):
Adjustment range: Auto, ON, OFF, nLO, nHI
Factory setting: Auto

MAN / MAN4
Adjustment range: Auto, ON, OFF
Factory setting: Auto

For control and service work, the operating mode of the controller can be manually adjusted. For this purpose, select the adjustment value **MAN**. The following adjustments can be carried out:
Auto : relay in automatic mode
ON : relay is switched on
OFF : relay is switched off
nLO : relay is switched with adjusted minimum speed
nHI : relay is switched with adjusted maximum speed

The controller is equipped with a shortcut that enables a quick access to the MAN menu (manual mode).

➔ In order to access the MAN menu, press buttons ⑥ and ⑦ at the same time, then press button ②.

i **Note**
Always adjust the operating mode back to "Auto" when the control and service work is completed. Otherwise normal operation will not be possible.

Blocking protection

```
                    SET
              BLPR 1
              OFF
```

BLPR1(2, 3)
Adjustment range: ON / OFF
Factory setting: ON

In order to protect the pumps against blocking after standstill, the controller is equipped with a blocking protection function. This function switches on the relays one after another every day at 12:00 a.m. for 10 s at 100%.

**Option: Thermal disinfection (OTDIS)**

OTDIS

Thermal disinfection function
Adjustment range: ON / OFF
Factory setting: OFF

This function helps to contain the spread of Legionella in the upper DHW store zone by systematically activating the backup heating.

Reference sensor for the thermal disinfection is the numerically first free sensor! Reference relay is the numerically first free relay!

OTDES / PDIS

Monitoring period
Adjustment range: 0 … 30:0 … 24 (dd:hh)
Factory setting: 01:00

For thermal disinfection, the temperature in the upper DHW store zone has to be monitored. This protection is ensured when, during the monitoring period, the disinfection temperature is continuously exceeded for the entire disinfection period.

OTDIS / DDIS

Disinfection period
Adjustment range: 00:00 … 23:59
Factory setting: 01:00

OTDIS / TDIS

Disinfection temperature
Adjustment range: 0 … 95 °C
Factory setting: 60 °C

If the thermal disinfection function is activated, the monitoring period starts as soon as the temperature at the reference sensor falls below the disinfection temperature.

When the monitoring period ends, the reference relay activates the backup heating. The disinfection period starts to count as soon as the temperature at the allocated sensor exceeds the disinfection temperature.

If the temperature at the reference sensor exceeds the disinfection temperature by more than 5 K, the reference relay switches off until the temperature has fallen below a value of 2 K above the disinfection temperature.

Thermal disinfection can only be completed when the disinfection temperature is exceeded for the duration of the disinfection period without interruption.

If the disinfection conditions have been fulfilled by solar loading before the monitoring period ends, thermal disinfection is considered complete and a new monitoring period begins.

i **Note**
If the thermal disinfection option OTDIS is activated, the display channels TDIS and CDIS will be displayed. TDIS will be displayed regardless of the temperature measured at the reference sensor.

Due to the flexible control logic, the exact time of thermal disinfection is not predictable. In order to set a fixed time for the disinfection, the starting delay can be used.

Thermal disinfection with starting delay

OTDIS / SDIS

Starting time
Adjustment range: 0:00 … 24:00
Factory setting: 00:00
full hours only

When a starting time for thermal disinfection with starting delay is adjusted, backup heating activation will be delayed until that time, even after the monitoring period has ended.

If the monitoring period ends, for example, at 12:00 o'clock, and the starting time has been set to 18:00, the reference relay will be energised with a delay of 6 hours at 18:00 instead of 12:00 o'clock.

If, before the delay time has elapsed, the disinfection conditions are fulfilled by solar loading, thermal disinfection is considered complete and a new monitoring period begins.

If the starting time is adjusted to 00:00 (factory setting), the delay function is inactive.

When thermal disinfection is activated, different display channels appear depending on the current status of the function (see also p. 44):

CDIS - countdown of the monitoring period

DDIS - countdown of the disinfection period

TDIS - substitutes TSTT during the disinfection period

SDIS - displays the adjusted starting time (flashing) during the delay time after the monitoring period has ended
OTDIS / TSDIS
Sensor thermal disinfection
Adjustment range: 2,3,4,5
Factory setting: system dependent

For this function, free sensors at an appropriate position can be selected.

OTDIS / RDIS
Relay thermal disinfection
Adjustment range: 2, 3, 4
Factory setting: system dependent
The relay for the thermal disinfection function can be selected.

Parallel relay

OPARR / PARRE
Parallel relay
Adjustment range 2, 3, 4
Factory setting: 2

With this function, e. g. a valve can be controlled in parallel to the pump via a separate relay **PARRE**.
If solar loading takes place (R1 and/or R2) or if a solar function is active, the relay selected will be energised. The parallel relay can also be energised inversely (**INVER**).

> **i Note**
> If R1 and/or R2 are in the manual mode, the selected parallel relay will not be energised.
Heat quantity measurement

OHQM
Heat quantity measurement
Adjustment range: OFF / ON
Factory setting: OFF

OHQM / FTYPE
Flow rate detection type
Selection: 1,2
Factory setting: 1

The heat quantity measurement can be carried out in 2 different ways (see below): without flowmeter (using a fixed flow rate value) or with a V40 flowmeter.
➔ Enable the heat quantity measurement option in the channel OHQM

➔ Select the type of flow rate detection in the channel FTYPE

Flow rate detection type:
1 : fixed flow rate value
2 : V40

SET
FMAX
6.0

OHQM / FMAX
Flow rate in l/min
Adjustment range: 0.5 … 100.0
Factory setting: 6.0

SET
MEDT
3

OHQM / MEDT
Heat transfer fluid
Adjustment range: 0 … 3
Factory setting: 3

SET
MED%
45

OHQM / MED%
Antifreeze concentration in vol. %
(MED% is "hidden" when MEDT 0 or 3 is used)
Adjustment range: 20 … 70 %
Factory setting: 45 %

Antifreeze type:
0 : water
1 : propylene glycol
2 : ethylene glycol
3 : Tyfocor® LS / G-LS

SET
FIMP
1.0

OHQM / FIMP
Pulse rate
Adjustment range: 0.5 … 99.0
Factory setting: 1.0

Heat quantity measurement with fixed flow rate value
The heat quantity measurement calculation (estimation) uses the difference between the flow and return temperatures and the entered flow rate (at 100 % pump speed).
➔ Adjust 1 in the channel FTYPE
➔ Read the flow rate (l/min) and adjust it in the channel FMAX.
➔ Adjust the antifreeze type and concentration of the heat transfer fluid in the channels MEDT and MED%.

i **Note**
FMAX cannot be selected in systems with 2 solar pumps (ARR 3, 4, 6, 8, 9).

i **Note**
The heat quantity measurement calculation (estimation) uses the difference between the flow and return temperatures and a flow rate value calculated from the entered flow rate (at 100 % pump speed) and the current pump speed.

Heat quantity measurement with V40 flowmeter
The heat quantity measurement calculation uses the difference between the flow and return temperatures and the volume flow transmitted by the flowmeter.
➔ Adjust 2 in the channel FTYPE
➔ In the channel FIMP, adjust the impulse rate corresponding to the V40 flowmeter used.
➔ Adjust the antifreeze type and concentration of the heat transfer fluid in the channels MEDT and MED%.

Adjustment range: 2, 3, 5
Factory setting: 2

For this function, free sensors at an appropriate position can be selected as flow and return sensors.

➔ In the channel SFHQM, select the flow sensor.
➔ In the channel SRHQM, select the return sensor.

Time and date

|	
SET TIME 12:00	**SET** YYYY 2011

DATE/TIME
Time
Adjustment range: 00:00 … 23:59
Factory setting: 12:00

DATE/YYYY
Year
Adjustment range: 2010 … 2099
Factory setting: 2010

|	
SET MM 03	**SET** DD 26

DATE/MM
Month

Adjustment range: 01 … 12
Factory setting: 03

DATE/DD
Day

Adjustment range: 01 … 31
Factory setting: 15

The date and time can be entered. Both are required for the thermostat function.

ROSA

SET ROSA 0005

ROSA
ROSA numbers
Adjustment range: 0000 …9999
In the ROSA channel, the 4-digit number given by the RESOL Online Service Assistant can be entered.

The following table shows the numbers available for the BX L with the corresponding system layouts.

System	ROSA number
ARR1	5
ARR2	16
ARR3	6
ARR4	17
ARR5	225
ARR6	226
ARR7	227
ARR8	29
ARR9	228

i **Note**
Because of the increasing size of the data packets, the remaining logging time does not decrease linearly. The data packet size can increase, e. g. with the increasing operating hours value.

en

Valve logic

VLOG
Valve logic
Adjustment range: 1, 2, 3, 4
Factory setting: 1
In this adjustment channel the valve logic can be adjusted.

Valve logic

1		
2		
3		
Flow direction when the valve is normally open	4	

Temperature unit

UNIT
Temperature unit
Adjustment range: °C, °F
Factory setting: °C
In this adjustment channel the temperature unit can be chosen.
The unit can be switched between °C and °F during operation.

Language

LANG
Language
Adjustment range: dE, En, ES, Fr
Factory setting: En

In this adjustment channel, the menu language can be chosen.
• dE : German
• En : English
• ES : Spanish
• Fr : French

SD card

If an SD card is used, **COM** is shown on the display. If the SD card is full, **COM** is flashing.

en

OSDC
SD card
Selection: ON / OFF
Factory setting: OFF

Starting the logging
➔ Insert the SD card into the slot
Logging will start immediately.
➔ Adjust the desired logging interval LOGI

LOGI
60

OSDC / LOGI
Logging interval
Adjustment range: 1 … 1200 s
Factory setting: 60 s

LLOG
OFF

OSDC / LLOG
Linear logging
Selection: ON / OFF
Factory setting: OFF

When **LLOG** is activated, data logging will stop if the capacity limit is reached. The message **CFULL** will be displayed.

When LLOG (linear logging) is deactivated, the oldest data logged onto the SD card will be overwritten as soon as the capacity limit is reached.
REMC
OFF

OSDC / REMC
Safely remove card
Adjustment range: ON / OFF
Factory setting: OFF

Completing the logging process
➔ Select the menu item **REMC**
➔ After **-REM** is displayed remove the card from the slot

FORM

OSDC / FORM
Format card

Formatting the SD card
➔ Select the menu item **FORM**
➔ During the formatting process, **--FORM** will be displayed.
The content of the card will be deleted and the card will be formatted with the FAT 16 file system.

Messages possible	Description
FSYS	File system error
CTYP	Card type is not supported
WRIT	Error during writing
NOCRD	No card in slot
LOGG	Logging is possible
WRITP	Card is write-protected
CFULL	Card full
RTIME	Remaining logging time in days
REMC	Safely remove card command
-REM	Card is being removed
FORM	Formatting SD card command
-FORM	Formatting in progress
LOGI	Logging interval in seconds
LLOG	Linear logging

6.3   Overview of options and their parameters

In the following, the additional options and parameters are listed.

The options and parameters displayed depend on the system as well as on the options and functions which have been selected. Some of the options and parameters will only be displayed, if they are available with the individual adjustments.

Channels

Channel	Sub channel 1	Sub channel 2	Factory setting	Change to	Description	Page

7 User code and short menu - Adjustment values

CODE

The access to some adjustment values can be restricted via a user code (customer). For safety reasons, the user code should generally be set to the customer code before the controller is handed to the customer!

1. Installer **0262** (Factory setting)
All menus and adjustment values are shown and all values can be altered.

2. Customer **0000**
The Installer level is not shown, adjustment values can be changed partly (see below)

➜ In order to restrict the access, enter 0000 in the menu item **CODE**.

The display changes to the status level. If the adjustment channel is selected afterwards, the short menu shown below will be available. The short menu suits the selected system.

➜ In order to authorise the access, enter 0262 in the menu item **CODE**.

Channel	Factory setting	Adjustment range	Designation
TIME	12:00	00:00 … 23:59	Time
DT1O	6	1.0 … 50.0 K	Switch-on temperature difference store
DT1F	4	0.5 … 49.5 K	Switch-off temperature difference store
DT1S	10	1.0 … 50.0 K	Set temperature difference store
S1MAX	60	4 … 95 °C	Store maximum limitation
DT2O	6	1.0 … 50.0 K	Switch-on temperature difference store 1
DT2F	4	0.5 … 49.5 K	Switch-off temperature difference store 1
DT2S	10	1.0 … 50.0 K	Set temperature difference store 1
S2MAX	60	4 … 95 °C	Store maximum limitation store 1
LST2	On	On/OFF	Loading store 2 on
DT3O	6	1.0 … 50.0 K	Switch-on temperature difference store 2
DT3F	4	0.5 … 49.5 K	Switch-off temperature difference store 2
DT3S	10	1.5 … 50.0 K	Set temperature difference store 2
S3MAX	60	4 … 95 °C	Store maximum limitation store 2
LST3	On	On/OFF	Loading store 3 on
MAN1	Auto	Auto/ON/OFF/n LO/n HI	Manual operation pump 1
MAN2	Auto	Auto/ON/OFF/n LO/n HI	Manual operation pump 2
MAN3	Auto	Auto/ON/OFF/n LO/n HI	Manual operation pump 3
MAN4	Auto	Auto/On/OFF	Manual operation pump 4
CODE	0000	0000/0262	User code

8 Messages

In the case of an error, the directional pad flashes red and a message is indicated in the status display. A warning triangle is additionally indicated. If more than one error or fault condition has occurred, only the one with the highest priority will be displayed as a message in the status display.

In the case of a sensor error, the corresponding relay is switched off, and a message appears on the display marked by an E. Additionally, a corresponding value for the error type assumed is indicated.

After the error has been removed, the error message disappears.

Error message	Value	Description	Solution
ES1 … 5	-88.8	Short circuit at sensor 1…7	Check the cable
	888.8	Broken cable at sensor 1 … 7	
PARAM		Remote parametrisation	Do not parametrise the controller via the push buttons during remote parametrisation

9   Troubleshooting

If a malfunction occurs, a message will appear on the display of the controller.
Fuse

The display is permanently off.

Press button ⑤. Display illuminated?

| no | yes |

Controller has been in standby, everything o.k.

Check the power supply of the controller. Is it disconnected?

| no | yes |

The fuse of the controller could be blown. The fuse holder (which holds the spare fuse) becomes accessible when the cover is removed. The fuse can then be replaced.

Check the supply line and reconnect it.

Directional pad flashes red. The symbol 🔧 is indicated on the display and the symbol ⚠ flashes.

Sensor fault. An error code instead of a temperature is shown on the corresponding sensor display channel.

| *888.8* | *- 88.8* |

Cable is broken.
Check the cable.

Short circuit.
Check the cable.

Disconnected temperature sensors can be checked with an ohmmeter. Please check if the resistance values correspond with the table.

| °C	°F	Ω	°C	°F	Ω
-10	14	961	55	131	1213
-5	23	980	60	140	1232
0	32	1000	65	149	1252
5	41	1019	70	158	1271
10	50	1039	75	167	1290
15	59	1058	80	176	1309
20	68	1078	85	185	1328
25	77	1097	90	194	1347
30	86	1117	95	203	1366
35	95	1136	100	212	1385
40	104	1155	105	221	1404

50	122	1194	115	239	1442

Resistance values of Pt1000 sensors

Note:
For answers to frequently asked questions (FAQ) see www.resol.com.
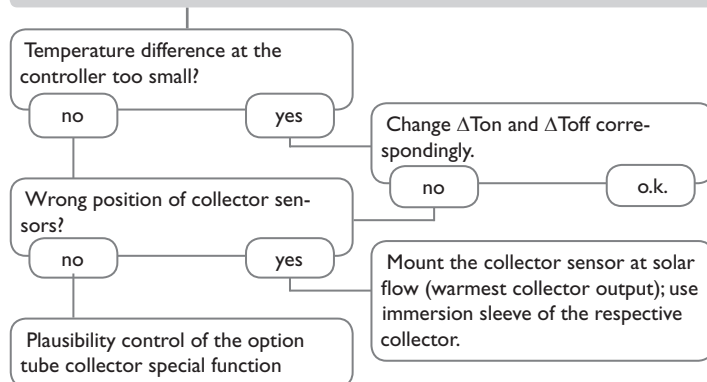

Pump is overheated, but no heat transfer from the collector to the store, flow and return have the same temperature; perhaps also bubbling in the lines.
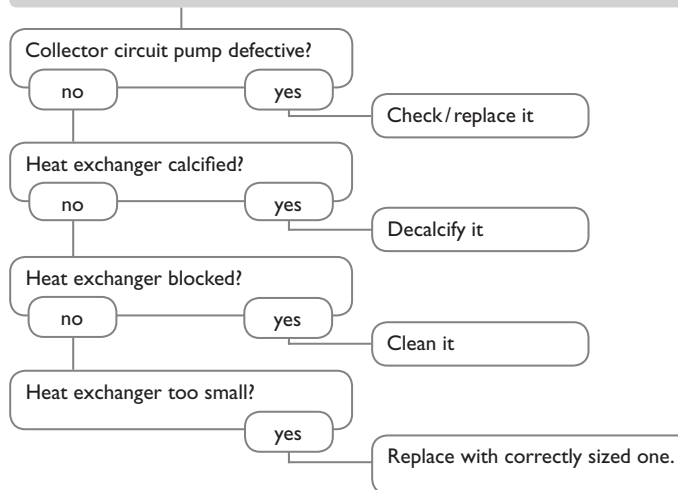

Air or gas bubbles in the system?
- no
- yes

Vent the system; increase the system pressure to a static primary pressure of at least plus 0.5 bar; if necessary continue to increase pressure; switch the pump on and off for a short time.

Is the collector circuit blocked at the dirt trap?
- yes

Clean dirt trap

Pump starts up very late.

Switch-on temperature difference ΔTon too large?
- no
- yes

Change ΔTon and ΔToff correspondingly.

Non-ideal position of the collector sensor (e. g. flatscrew sensor instead of sensor in immersion sleeves).
- yes

Activate tube collector function if necessary.
- o.k.

Pump starts for a short moment, switches off, switches on again, etc.

Temperature difference at the controller too small?
- no
- yes

Change ΔTon and ΔToff correspondingly.
- no
- o.k.

Wrong position of collector sensors?
- no
- yes

Mount the collector sensor at solar flow (warmest collector output); use immersion sleeve of the respective collector.

Plausibility control of the option tube collector special function

---

The temperature difference between store and collector increases enormously during operation; the collector circuit cannot dissipate the heat.

Collector circuit pump defective?
- no
- yes

Check/replace it

Heat exchanger calcified?
- no
- yes

Decalcify it

Heat exchanger blocked?
- no
- yes

Clean it

Heat exchanger too small?
- yes

Replace with correctly sized one.

The solar circuit pump does not work, although the collector is considerably warmer than the store.

Display illuminated?
If not, press button (5).
Display illuminated again?
- yes
- no → There is no current; check fuses / replace them and check power supply.

Does the pump start up in manual operation?
- no
- yes → The adjusted temperature difference for starting the pump is too high; choose a value which makes more sense.

Is the pump current enabled by the controller?
- no
- yes → Is the pump stuck?
  - yes → Turn the pump shaft using a screwdriver; now passable?
    - no → Pump is defective - replace it.

Controller might be defective - replace it.

Stores cool down at night.

Collector circuit pump runs during the night?
- no
- yes → Check controller

Collector temperature at night is higher than the outdoor temperature.
- no
- yes → Check the non-return valves in the flow and the return pipe for functional efficiency.

Sufficient store insulation?
- yes
- no → Increase insulation.

a

---

a

Insulation close enough to the store?
- yes
- no → Replace insulation or increase it.

Are the store connections insulated?
- yes
- no → Insulate the connections.

Warm water outflow upwards?
- no
- yes → Change connection and let the water flow sideways or through a siphon (downwards); less store losses now?
  - no
  - yes → o.k.

Does the DHW circulation run for a very long time?
- no
- yes → Use the circulation pump with timer and switch-off thermostat energy-efficient circulation).

Circulation pump and blocking valve should be switched off for 1 night; less store losses?
- yes
- no → Check whether the pumps of the after-heating circuit run at night; check whether the non-return valve is defective; problem solved?
  - no

Check the non-return valve in warm water circulation - o.k.
- yes
- no → Further pumps which are connected to the solar store must also be checked.
  → Clean or replace it.

The gravitation circulation in the circulation line is too strong; insert a stronger valve in the non-return valve or an electrical 2-port valve behind the circulation pump; the 2-port valve is open when the pump | is activated, otherwise it is closed; connect pump and 2-port valve electrically in parallel; activate the circulation again. Deactivate pump speed control!

10   Accessories

10.1   Sensors and measuring instruments

Temperature sensors

The product range includes high-precision platinum temperature sensors, flatscrew sensors, outdoor temperature sensors, indoor temperature sensors, cylindrical clip-on sensors, also as complete sensors with immersion sleeve.

Overvoltage protection device

In order to avoid overvoltage damage at collector sensors (e.g. caused by local lightning storms), we recommend installing the overvoltage protection RESOL SP10.

V40 flowmeter

The RESOL V40 is a measuring instrument for detecting the flow of water or water / glycol mixtures. After a specific volume has passed, the V40 reed switch sends an impulse to the calorimeter. The heat quantity used is calculated by the calorimeter using these impulses and the measured temperature difference with the help of pre-defined parameters (glycol type, concentration, heat capacity, etc.).

10.2   Interface adapters

Interface adapters VBus® / USB and VBus® / LAN

The new VBus® / USB interface adapter is the interface between the controller and a personal computer. With its standard mini-USB port it enables a fast transmission of system data for processing, visualising and archiving as well as the parametrisation of the controller via the VBus®. A full version of the RESOL ServiceCenter software is included.

The VBus® / LAN interface adapter is designed for the direct connection of the controller to a PC or router. It enables easy access to the controller via the local network of the owner. Thus, controller access, system parametrisation and data charting can be effected from every workstation of the network. The VBus® / LAN interface adapter is suitable for all controllers equipped with a RESOL VBus®. A full version of the RESOL ServiceCenter software is included.

Smart Display SD3 / Large Display GA3

The RESOL Smart Display is designed for simple connection to RESOL controllers with RESOL VBus®. It is used for visualising data issued by the controller: collector temperature, store temperature and energy yield of the solar thermal system. The use of high-efficiency LEDs and filter glass assures a high optical brilliance and good readability even in poor visibility conditions and from a larger distance. An additional power supply is not required. One module is required per controller.

The RESOL GA3 is a completely mounted large display module for visualisation of collector- and store temperatures as well as the heat quantity yield of the solar system via one 6-digit and two 4-digit 7-segment-displays. An easy connection to all controllers with RESOL VBus® is possible. The front plate is made of antireflective filterglass and is printed with a light-resistant UV-lacquering. The universal RESOL VBus® allows the parallel connection of 8 large displays as well as additional VBus® modules.

AM1 Alarm module

The AM1 Alarm module is designed to signal system failures. It is to be connected to the VBus® of the controller and issues an optical signal via the red LED if a failure has occurred. The AM1 also has a potential-free relay output, which can e. g. be connected to a building management system (BMS). Thus, a collective error message can be issued in the case of a system failure. Depending on the controller and the sensors connected, different fault conditions can be signalled, e. g. sensor failures, excess or negative system pressure as well as errors in the flow rate, such as a dry run of the pump.

The AM1 Alarm module ensures that occurring failures can be immediately recognised and repaired, even if the system and the controller are difficult to access or located in a remote place. Thus, the reliability and the stable yield of the system are ensured.
