

RESOL press release

Hattingen, 28 May 2014

Create an intelligent heat network – with the KM1 Communication module

The KM1 communication module is the network connection for solar and heating systems, especially suited for technicians managing large systems, heating installers and home owners who like to keep a close eye on their system.

With the KM1, the system can be monitored over the Internet. VBus.net enables e. g. system yield monitoring in a comprehensive system graphic.

Additionally, comfortable system parameterisation via the RESOL ServiceCenter software or the RESOL RPT parameterisation tool is possible. The KM1 communication module is suitable for all RESOL controllers equipped with a VBus®

For all those who want more for their system than just an Internet connection, RESOL offers further solutions for networking the solar and heating system. The DL2 and DL3 Dataloggers log system data and are equipped with a number of data interfaces. The DL3 additionally offers BACnet functionality for the connection to a building management system (BMS) and can log data of up to 6 controllers at the same time.

Further information about the KM1 Communication module, the DL2 and DL3 Dataloggers as well as the large RESOL product portfolio can be found at www.resol.com
